Cost Simulation Tool for Long-Term Care Systems

Description

The cost simulation tool for long-term care systems provides a way to quickly estimate how much it would cost governments in Latin America and the Caribbean to implement this type of system. It can also be used to compare different service packages and make projections.

The spreadsheet contains data on population, levels of care dependence, and other macroeconomic variables that are processed by formulas to allow users to quickly estimate how much it would cost a government to implement a long-term care system in 2020. Users can estimate the cost of up to two long-term care service packages and project costs for 2025 and 2030.

IDB unit in charge of the project: Social Protection and Health Division of the Social Sector (SCL/SPH)

Author: Nadin Medellín nadinm@iadb.org

Last updated: September 2020

Temporal scope: 2020-2030.

Spatial scope: Argentina, Bahamas, Barbados, Belize, Bolivia, Brazil, Chile, Colombia, Costa Rica, Ecuador, El Salvador, Guatemala, Guyana, Haiti, Honduras, Jamaica, Mexico, Nicaragua, Panama, Paraguay, Peru, Dominican Republic, Suriname, Trinidad and Tobago, Uruguay, and Venezuela.

Description of variables:

Name of variable	Unit	Description	Temporal scope
Care dependence rate	percentage	Estimate of the percentage of the population that depends on long-term care by age group and level of care dependence based on United Nations population estimates and projections and care dependence data from the IDB's Panorama of Aging and Long-Term Care	2020, 2025, 2030
Number of care-dependent people	thousands of people	Number of care-dependent people by age group and level of care dependence	2020, 2025, 2030

Name of variable	Unit	Description	Temporal scope
Cost of a long-term care system	millions of USD	Estimate of the cost of long-term care systems based on the parameters set by the simulation tool user.	2020, 2025, 2030
Relative cost of a long-term care system	percentage	Estimate of the cost of long-term care systems expressed as a percentage of gross domestic product based on the parameters set by the simulation tool user.	2020, 2025, 2030
Public funding per type of service	percentage	Percent of public funding allocated to each type of long-term care service in a system	2020, 2025, 2030
Change in the cost of long-term care systems, assuming a constant care dependence rate in the future	percentage	Projected change in the cost of a long-term care system, assuming that the care dependence rate remains constant. (2020 is used as a baseline)	2025, 2030
Change in the relative cost of long-term care systems, assuming a constant care dependence rate in the future	percentage	Projected change in the cost of a long-term care system expressed as a percentage of GDP, assuming that the care dependence rate remains constant. (2020 is used as a baseline)	2025, 2030
Change in the cost of long-term care systems, assuming a changing care dependence rate.	percentage	Projected change in the cost of a long-term care system based on a care dependence rate that changes according to the parameters set by the cost simulation tool user. (2020 is used as a baseline)	2025, 2030
Change in the relative cost of long-term care systems, assuming a changing care dependence rate.	percentage	Projected change in the cost of a long-term care system, expressed as a percentage of GDP, based on a care dependence rate that changes according to the parameters set by the cost simulation tool user. (2020 is used as a baseline)	2025, 2030
Amount collected through copayments	Millions of USD	The amount collected by implementing the copayment scheme selected by the cost simulation tool user, in millions of dollars	2020
Amount collected from copayments as a percentage of GDP	percentage	The amount collected by implementing the copayment scheme selected by the cost simulation tool user, as a percentage of GDP	2020
Amount collected from copayments as a percentage of the total cost of the system	percentage	The amount collected by implementing the copayment scheme selected by the cost simulation tool user, as a percentage of the total cost of the system	2020

Note: The accompanying technical note, “Cost Simulation Tool for Long-Term Care Systems: An application to Latin America and the Caribbean,” describes how to use the Excel file containing the cost simulation tool. It also gives details on the method used to perform the cost simulations and on the tool’s underlying data. Available at <https://www.iadb.org/en/panorama/cost-simulation-tool>.

Acknowledgments:

The Cost Simulation Tool for Long-term Care Systems was created using funds from the IDB Economic and Sector Study “Active and Healthy Aging: The cost of inaction and elements for

action” (RG-E1656). The cost simulation tool and this technical note are based on an unpublished paper by María del Carmen Hernández Ruiz and Pablo Ibarrarán in which they applied the same cost model to Colombia and Mexico. A preliminary version of this simulation tool was used to prompt a technical discussion about long-term care services among government representatives and experts during the 2019 Regional Policy Dialogue entitled “Pillars of Long-term Care: How to Build a System” (<https://events.iadb.org/calendar/event/20900>).

The author would like to thank the Social Protection and Health Division Chief, Ferdinando Regalia, for his support and leadership and for furthering the development of knowledge products about aging and long-term care. The input and comments of Natalia Aranco, Gianluca Cafagna, Pablo Ibarrarán, María Laura Oliveri, and Marco Stampini were extremely important during the process of designing the cost simulation tool and writing the technical note that goes with it. Soledad Planes was in charge of the editorial, digital, and strategic communication, and Diego Vapore did the graphic design for both the cost simulation tool and the outreach materials. The cost simulation tool was professionally edited by Patricia Ardila and translated into English by Collin Stewart. The author is responsible for any errors and omissions.
