

Dataset: Primary Healthcare Access, Experience, and Coordination in Latin America and the Caribbean 2013 (PRIMLAC)

Brief Description

With the aim of contributing to the design of evidence-based public health policies in Latin America and the Caribbean and giving special consideration to patient or health service user perspectives, between 2012 and 2014 the Inter-American Development Bank carried out the Primary Care Access, Experience and Coordination Survey in Latin America and the Caribbean, in adult populations in Colombia, Mexico, Brazil, El Salvador, Panama and Jamaica. More detail about the motivations, conceptual framework, and detailed methodology of the survey can be found the publication “[Desde el paciente: Experiencias de la atención primaria de salud en América Latina y el Caribe](#)” (in Spanish). Primary Healthcare Access, Experience, and Coordination in Latin America and the Caribbean is a dataset of 9,012 observations, that merges the three waves of data collection in the survey, conducted between 2012 and 2014 in: Colombia and Mexico; Brazil and El Salvador; and Panama and Jamaica. The sections below describe the survey methodology, the structure of the questionnaire used for the interviews, and present a detailed codebook of the dataset, generated by Stata 15.1 statistical analysis software.

Format

Stata 15.1 data file (.dta).

Authors

The dataset was edited by Frederico Guanais and Milagros Anaya.

Contact Person

Frederico Guanais, Health Principal Specialist, fredericog@iadb.org.

Years of coverage

Cross-sectional data collected between September 2012 and February 2014.

Related Publications

Doubova, Donna Oretha Harris, Tania Marín, Ralfh Moreno, et al. 2018. *Desde El Paciente: Experiencias de La Atención Primaria de Salud En América Latina y el Caribe*. Edited by Frederico Guanais, Ferdinando Regalia, Ricardo Perez-Cuevas, and Milagros Anaya. Washington, DC: Inter-American Development Bank.

Data source

Data collection was commissioned to the surveying firm Harris Interactive by the Inter-American Development Bank.

Survey methodology

- Sample design and characteristics of the interviews.

The data were collected through telephone interviews, including fixed and mobile telephone lines between random samples of adult populations in each country (over 18 years of age), which were contacted by random selection of telephone numbers. The final sample included 9,012 adults 18 years of age or older. The Harris Interactive/Nielsen polling firm was contracted to design the sampling strategy, to carry out the programming of the questionnaire in software to support the telephone interview, to train the interviewers, to conduct all the interviews, to collect the data, to verify the consistency and quality of the bases, calculate the sample weights and generate the databases, through a standardized protocol in all countries.

In each country, telephone interviews were conducted with a national sample of non-institutionalized adult population, taken from fixed and mobile residential telephone lists prepared by the Harris Interactive/Nielsen surveyor and its associated companies in each country. Minimum quota goals were established by sex and age in geographic regions of the countries, used to monitor the representativeness of the samples compared to the latest available census surveys. Mobile and landline telephone numbers were included, which allowed for representative samples of both rural and urban populations. The interviews were conducted in Portuguese for Brazil, in English for Jamaica, and in Spanish for the remaining countries.

A specific sampling frame was designed for the six countries that sought to capture the representativeness of the national adult population (over 18 years of age), according to established specifications to achieve a margin of error of +/- 3.5% and a 95% confidence interval, which resulted in a minimum sample of 1,500 observations per country. For this study, a minimum response rate of 20% was also specified, by using the following calculation formula:

$$\text{Response rate} = \frac{\text{Completed questionnaires}}{\left(\text{available sample} - \left(\text{non-working numbers} + \text{business numbers} + \text{inelegible < age 18} + \text{refusals} \right) \right)}$$

The study was carried out in the six countries according to these specifications. The following table presents the sample disposition data.

Sample Disposition and characteristics of the interviews

Characteristics	Brazil	Colombia	El Salvador	Jamaica	Mexico	Panama
Loaded sample (n)	8,000	7,136	11,000	18,606	9,544	14,897
Available sample (n)	5,978	6,668	10,480	18,241	8,000	13,900
Total calls (n)	6,111	24,197	30,788	60,319	13,392	33,394
Non-working phone numbers (n)	1,217	498	2,906	8,943	809	3,757
Business numbers (n)	285	113	1,295	5	557	1,662
Ineligible—under 18 (n)	86	26	683	373	577	2,656
Refusal (n)	705	851	2,172	4,071	1,204	1,348
Completed interviews (n)	1,501	1,501	1,500	1,506	1,503	1,514
Response rate (%)	40.7	29.0	43.8	31.1	31.0	33.8
Average duration (minutes)	20	27	22	28	24	27

Source: Harris Interactive/Nielsen.

The number of completed interviews fell between a low of 1,500 in El Salvador to a high of 1,514 in Panama, and overall response rates by country ranged from 29% in Colombia to 43.8% in El Salvador, meeting the specifications established a priori. The average duration of the interviews was a minimum of 20 minutes in Brazil and a maximum of 28 minutes in Jamaica.

Data collection was conducted through a computer-assisted telephone interview, using a platform accessible via web browser (computer-assisted telephone interviewing over web [COW – CATI]). The questionnaires were programmed into the system, along with algorithms that introduced, in real time, the following seven procedures to ensure the consistency and quality of the interviews and data recording: (a) a series of questions and answers; (b) skip patterns (e.g., the non-applicability of questions depending on the respondent's age or sex); (c) question rotation; (d) range checks during data recording; (e) mathematical checks; (f) consistency checks; and (g) special edit procedures. COW systems reduce administrative error by eliminating the need for data entry, since interviewers enter respondents' answers directly into a computer during the interview. For questions with precoded answers, the system only allows responses within a specified range; for example, if a question has three possible response options, the COW system will only accept encoded responses corresponding to those options. All the data is compiled, and its internal consistency is verified.

Information about the place of residence, age, sex, socioeconomic status, education and household size was gathered with the goal of establishing target sample weights for the survey in each country. Then, a random iterative method (RIM) weighting procedure was used, which means that the weights were applied iteratively for each individual variable included in the weighting. This procedure seeks to guarantee that the distributions for each of the variables of interest closely reflect their targets. It is conducted by reducing non-response bias and correcting the differential non-response rate in different groups of variables of sample characteristics, using data from the most recent national censuses of each country. After this iterative process—the RIM weighting—each respondent ends up with a single weight value. Individual weight values were subsequently standardized to limit outliers or any extreme weighting.

Structure of the questionnaire

The questionnaire included between 90 and 98 questions (the exact number varied depending on the country) and its structure was evaluated so that it could be answered in an average time of 20 minutes, considering that the response pattern depends on the specific circumstances of each respondent. The questionnaire is divided into 11 sections, as described below:

- a) Introduction and basic data (five questions): presentation, survey objectives and type of information that will be collected, age, sex and location of the respondent.
- b) Overview of the health system (three questions): general opinion of the country's health system, confidence in receiving effective treatment and in being able to pay for necessary care.
- c) Primary care (27 questions): utilization of primary care, type of provider, organizational and financial access barriers, wait time for an appointment, ease of care on nights and weekends, search for care in the same place, type of center usually used, length of contact with the regular place of care, participation of nurses and other health personnel in the care, forms of communication with the health center, channels for scheduling appointments, experience and interpersonal treatment during the consultation, help from primary care in the coordination of care with other levels, need for referral to other levels, rating of the care received in the regular place of care, numbers of doctors consulted.
- d) Specialty care (five questions): use of specialty care, wait time for an appointment, flow of medical history between primary care and specialty care.
- e) Hospitalization and emergency room (10 questions): need for scheduled or elective surgeries; wait time for a scheduled or elective surgery; hospitalization for one night or more; use of emergency room or rehospitalization after hospital discharge; support from the hospital in the coordination of care during the hospital discharge process; emergency room use in general; coordination of care during the discharge process from the emergency room; emergency room use due to a condition that could have been treated by primary care.
- f) Health coverage (2 questions): type of coverage (public and/or private) and duration of current coverage type.
- g) Out-of-pocket expenses and medical bills (four questions): total amount of out-of-pocket spending on medical care and prescription drugs; method of paying for treatments or services not covered by insurance; difficulties in paying medical bills or receiving reimbursement for medical expenses incurred.
- h) Use of prescription drugs (five questions): number of prescription drugs, evaluation by the primary care physician of all prescription medications, explanation of the side effects of medications by the primary care physician, method of costing the medications prescribed and their availability.

- i) Health status (10 questions): self-reported general health status, number of days that the patient did not feel good, previous diagnosis of arthritis, asthma or chronic obstructive pulmonary disease, cancer, depression or anxiety, diabetes, heart disease, hypertension, high cholesterol.
- j) Preventive care (13 questions): checks and current status of blood pressure and blood glucose level, confidence in being able to handle chronic diseases, preventive check-ups for cervical cancer and breast cancer, check of cholesterol level, performance of routine medical exams, guidance on healthy lifestyles and eating.
- k) Socioeconomic status (between 6 and 14 questions): level of education of the respondent and the head of the household, and measures of socioeconomic status (vary by country).

A detailed codebook of the dataset generated by Stata 15.1 Software is presented in the appendix to this document.
